Additional toxicological information:

Epidemiological and clinical studies did not show any significant health hazards in workers exposed to industrial carbon black.

The scientific discussions over the tumorigenic effect of insoluble, inorganic particles (fine dust) - such as carbon black - are still ongoing. According to many inhalation toxicologists, the tumors observed in the rat experiments result from a species-specific mechanism due to an overstressing of the rat lung (overload phenomena).

No corresponding finding have been found following the exposition to humans. The IARC, however, assesses the present rat studies in the Monograph 65 as sufficient evidence for the carcinogenicity of carbon black in animal studies.

According to the IARC, there is no evidence for the carcinogenic effect of carbon black for humans. The overall assessment of carbon black: "probably carcinogenic to humans" (group 2B) results from the IARC evaluation scheme.
