

11312 Thulite

Very lightfast and binder-resistant pigment. Thulite is a pink-red colored zoisite specialty from Norway. Together with Kremer White, the shade is ideally suited for incarnate material for depicting skin color.

Thulite is finely 80 μ sieved. Despite the fine grind, the pigment has a graininess and hardness that make it difficult to use in aqueous techniques such as watercolor and tempera. In acrylic, on the other hand, thulite can be processed excellently. The pigment is also resistant enough for lime and silicate techniques. We do not recommend this pigment for oil, as its hardness makes it difficult to work with and it dries poorly.
